

FACT SHEET: Anti-COVID-19 Public Health Strategy in the Netherlands

Scientific Facts for the Dutch People – Questions to the Dutch Government

New scientific facts fundamentally questioning the safety of vaccines used in the Netherlands

On November 12, 2021, we informed the Dutch government in an emergency letter about new scientific evidence fundamentally questioning the safety of the RNA/DNA-based anti-COVID-19 vaccines currently recommended by the governments of the Netherlands and other countries.

This new evidence came from a [scientific study](#)¹ published in October by independent scientists from Swedish universities. It emphasized the fact that a protein from the surface of the coronavirus (SPIKE protein) inhibits the essential damage repair system in the software (DNA) of human cells. This scientific finding has specific relevance for the current RNA/DNA-based vaccines recommended to millions of people around the world: the very basis of these vaccines is to stimulate the production of exactly this SPIKE protein inside the human body.

The consequences of these findings are far-reaching and affect the health and lives of potentially tens of millions of people already vaccinated. For the first time, they provide a scientific explanation for the extremely short protection period of these RNA/DNA-based vaccines of only a few months – and the growing number of side-effects observed with these vaccines. Moreover, these findings imply that these damaging effects would be further aggravated with every booster vaccination.

In light of these scientific facts, all vaccinations with these RNA/DNA anti-COVID-19 vaccines must be halted immediately until such potentially devastating consequences have been conclusively ruled out. Such was the demand of our open letter to the Dutch government in November. Our emergency letter also emphasized the availability of alternatives in the form of vaccinations with dead (attenuated) viruses or protein-based viral fragments. It particularly focused on the benefits of science-based micronutrient compositions that have been shown to be effective against various coronavirus mutations.

Official response by the office of prime minister Rutte

In the official response to our emergency letter (see attachment), the office of prime minister Rutte made the following statements with respect to the efficacy and safety of RNA/DNA-based anti-COVID-19 vaccines as well as to the validity of the micronutrient benefits towards the control of the pandemic. This fact sheet exposes this government's answers as misleading and false and asks the compelling question of 'Why'.

I. In relation to the safety and efficacy of the RNA/DNA-based anti-COVID-19 vaccines the Dutch government made the following statements

Read more on the next page

“The mRNA molecules used in the Moderna- and BioNTech/Pfizer-vaccines have no effect on peoples DNA. ... This applies to vector vaccines AstraZeneca and Janssen as well. The vector-vaccines differ from mRNA vaccines as they deliver the code with the help of a harmless virus, but there is also no effect on people’s DNA.”
This misleading information needs urgent correction.

Health facts as to the safety and efficacy of RNA/DNA anti-COVID-19 vaccines:

1. Traditional vaccinations against measles, diphtheria, and many other viruses provide lifetime protections for those vaccinated. Essentially all these vaccines that have been successfully used for decades are either attenuated viruses or contain protein-based structural fragments of the virus. The superior safety of these vaccinations is due to the fact that these protein-based molecules do not enter the nucleus of body cells and do not interfere with the biological software (DNA) of the cells.
2. In contrast, all anti-COVID-19 vaccines currently used in the Netherlands and many other countries use an experimental vaccine based on the genetic blueprint (RNA or DNA) for the viral SPIKE protein. The vaccine manufacturers tell us that their vaccines induce the production of SPIKE proteins inside the body cells to produce antibodies that provide immunity against further infections with this virus. This immunity is far from effective since many vaccinated persons are newly affected by coronavirus infections, and booster immunizations are now called for every few months.
3. In October, this phenomenon of short immunity received a scientific explanation. As mentioned above, the spike proteins induced by the RNA/DNA vaccines do not stay outside the nucleus of body cells. In fact, they not only enter this cellular ‘control center’, but they actively interfere with the DNA software and paralyze its damage repair system.
4. Already in September 2021, scientific evidence became available that the coronavirus SPIKE protein shared architectural components with several other pathogens, including the infective agents for whooping cough (pertussis), diphtheria, tetanus, and others. [This paper](#)² also raised the specific possibility of the currently used (SPIKE-inducing) RNA/DNA vaccines causing cancers of the lung and other organs.
5. There are two main consequences of blocking these essential repair mechanisms in our DNA:
 1. The immune system is becoming ineffective and unable to provide efficient immunity – thus, explaining the rapid decline of immune protection of currently used RNA/DNA vaccinations.
 2. Unrepaired DNA is the foundation for severe biological malfunctions and the development of cancer and other diseases.

In summary, the use of RNA/DNA-based vaccines that code for the SPIKE protein is potentially creating the precondition for the very failure of the immune system to protect the body against further COVID-19 infections. Worse, these vaccines predispose the human body to develop cancers and other diseases.

Questions to the Dutch government:

1. Previous pandemics have been successfully contained with protein-based vaccines. Successful clinical trials have been conducted with attenuated coronaviruses early on during the COVID-19 pandemic. Why are such effective and safe vaccination strategies not being offered to the people of the Netherlands and other countries?
2. Why are all anti-COVID-19 vaccines in the Netherlands and Europe RNA/DNA-based – excluding essentially all other vaccine technologies with potentially much higher levels of efficacy and safety?
3. What role does the patentability of vaccines play in this decision by the Dutch government? Vaccines with attenuated viruses or fragments thereof are not patentable – whereas RNA/DNA vaccines are. Why has the European Medical Agency – an agency of the ‘Brussels EU’ – exclusively registered patentable anti-COVID-19 vaccines to be used on people in Europe?
4. Why is the Dutch government considering to mandate nationwide vaccination campaigns with vaccines that potentially have such far-reaching damaging health consequences for its population?
5. Why does the Dutch government now recommend repeated booster vaccinations in light of the scientific fact that any such repeat vaccination can further compromise the immune system and trigger more cancers and other diseases in the future?
6. Why does the Dutch government encourage mass vaccinations among an entire generation of children and juveniles – while relying on misleading information from the investment business of manufacturers of patentable vaccines? Why does it take this misleading information as the basis for its public health recommendation and, thereby, risk incalculable health consequences for the people of the Netherlands?

II. In relation to the scientifically proven health benefits of vitamins and other micronutrients as part of a nationwide effective and safe strategy against the COVID-19 pandemic, the Dutch government made the following statements:

“Too little research is available on vitamin C in the prevention of COVID-19.”

This statement is false and misleading for millions of people seeking to improve their immune system and looking for effective and safe natural ways to cope with the current pandemic.

The scientific facts in connection with the health benefits of vitamins and other micronutrients and their effectiveness against COVID-19 are:

1. Vitamins and other plant-based micronutrients are the only molecules known to science and medicine that are able to optimize the immune system in its entirety, including the response of police cells (leukocytes) to invading viruses and their biological removal (phagocytosis).

Read more on the next page

2. These basic facts of virology have been recognized in more than half a dozen Nobel prizes and are documented in every leading textbook of biology and other life sciences.
3. COVID-19 is a human-specific pandemic and does not occur in living species that are able to produce high levels of vitamin C in their own body. The coronavirus can infect animals but does not cause a pandemic. The human species that have lost the ability for endogenous vitamin C production during evolution is mainly exposed to the coronavirus.
4. Intravenous vitamin C, corresponding approximately to the level of vitamin C produced in other species compared to the human body weight, has thus far been the [only medical approach](#)³ able to cut in half the death rate of severely ill, hospitalized COVID-19 patients.
5. Selected combinations of micronutrients have been shown to effectively [inhibit all known pathways](#)⁴ of coronavirus infections in human body cells. Moreover, these combinations were effective against all known mutations of the current coronavirus pandemic.
6. These specific micronutrients are, among others, able to [reduce the production/expression of the cellular gateways](#)⁵ for coronavirus entry (infection), the so-called ACE-2 receptor. Since all mutations of the coronavirus – including the current Omicron variant – use this receptor as the gateway for infection, such micronutrient combinations potentially represent the only effective strategy against the Omicron variant at this time.

Questions to the Dutch government in connection with their denial of the scientific facts about the benefits of vitamins and other micronutrients in fighting the COVID-19 pandemic:

1. Why is the office of prime minister Rutte making such blatantly false statements denying Nobel prize-winning science and decades of scientific research?
2. Why is the Dutch prime minister ignoring [almost 500 scientific studies](#)⁶ documenting health benefits of vitamins and other micronutrients specifically in the fight against the COVID-19 pandemic – studies that everyone can access via the world's largest online medical library at pubmed.gov?

In summary, any public statement made by the prime minister during press conferences and other public appearances has – obviously – no scientific basis.

It is the responsibility of independent Dutch media – and above all the people of the Netherlands – to remind the prime minister and the entire government of their duties to first and foremost serve the health interests of the people of the Netherlands.

Dr. M. Rath
